RESULT 2 T28140

natural killer cell receptor homolog - chicken (fragment)
C;Species: Gallus gallus (chicken)
C;Species: Gallus gallus (chicken)
C;Species: Gallus gallus (chicken)
C;Date: 15-Oct-1999 #sequence_revision 15-Oct-1999 #text_change 15-Oct-1999
C;Accession: T28140
R;Milne, S:; Kaufman, J:; Beck, S:
Submitted to the EMBL Data Library, May 1998
A;Poescription: DNA sequencing and analysis of the chicken major histocompatibility comp A;Reference number: Z20475
A;Accession: T28140
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: DNA

botrocetin alpha chain - jararaca
N'Alternate names: two chain botrocetin alpha chain
C;Species: Bothrops jararaca (jararaca)
C;Date: 21-Sep-1993 #sequence_revision 18-Nov-1994 #text_change 15-May-1998
C;Accession: A47267; B37958
C;Accession: A47267; B37958

A,Role: 146-Arg was also found
C,Comment: This galactose-binding lectin is isolated from the coelomic fluid.
C,Comment: This protein plays important roles in defense mechanisms and in development
C,Comment: The molecule is a tetramer of identical chains.
                                      A,Title: The amino-acid sequence of a lectin of the acorn barnacle Megabalanus rosa.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and mouse CDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-: SUBCELLULAR LOCATION: Type II membrane protein (Probable).

-: TISSUB SPECIFICITY: Expressed preferentially in lymphoid tissues, and in most hematopoietic cell types.

-: SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN)

Suzuki M., Matsui T., Titani K., Yoshioka A.;

"The CDNA cloning and molecular characterization of a snake venom
platelet glycoprotein Ib-binding protein, mamushigin, from Agkistrodon
halys bromhoffii venom.";

Thromb. Haemost. 79:1199-1207(1998).

-! FONCTION: Binds to platelet glycoprotein Ib and enhances platelet
aggregation at low-shear stress. At high-shear stress, aggregation
is inhibited.

                                                                                                                                                                                                                      platelet agglutination.
FUNCTION: There are two distinct forms of the von Willebrand factor-dependent platelet coagglutinin. The dimeric form is 34-times more active than the one-chain botrocetin in promoting vWF binding to platelets.
SUBUNIT: Disulfide-linked dimer of an alpha and a beta chain. Botrocetin and vWF form a soluble complex.
SUBCELLULAR LOCATION: Secreted.
SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                               toxin botrocetin.";
Structure 10:943-950(2002).
-!- FUNCTION: Two-chain botrocetin forms an activated complex with vWF, and the complex then binds to platelet GPIb, resulting in
